Elements of AIML

Unit 05 – Lecture 01: AI for Society, Women & Environment

Tofik Ali

School of Computer Science, UPES Dehradun

February 28, 2026

Topic focus: **responsible AI** — fairness, privacy, safety, sustainability

Repository: `https://github.com/tali7c/Elements-of-AIML`

Sources: NIST, *AI Risk Management Framework (AI RMF 1.0)*, 2023.;Barocas, Hardt, and Narayanan, *Fairness and Machine Learning* (online book), selected sections.;Knaflic, *Storytelling with Data*, selected chapters on communicating results.

Quick Links

Why Bias/Fairness Privacy Environment Summary

Agenda

Why responsible AI?

Bias and fairness

Privacy and security

Environment and sustainability

Summary

Learning Outcomes

By the end of this lecture, you should be able to:

- Explain why AI/ML requires responsible practices in real deployments.

Learning Outcomes

By the end of this lecture, you should be able to:

- Explain why AI/ML requires responsible practices in real deployments.
- Define common sources of bias and explain fairness at a high level.

Learning Outcomes

By the end of this lecture, you should be able to:

- Explain why AI/ML requires responsible practices in real deployments.
- Define common sources of bias and explain fairness at a high level.
- Describe privacy risks in data-driven systems.

Learning Outcomes

By the end of this lecture, you should be able to:

- Explain why AI/ML requires responsible practices in real deployments.
- Define common sources of bias and explain fairness at a high level.
- Describe privacy risks in data-driven systems.
- Discuss environmental and sustainability considerations for AI.

Abbreviations & Keywords

- PII: personally identifiable information

Abbreviations & Keywords

- PII: personally identifiable information
- Bias: systematic error/unfairness; Fairness: equitable outcomes/treatment

Abbreviations & Keywords

- PII: personally identifiable information
- Bias: systematic error/unfairness; Fairness: equitable outcomes/treatment
- Audit: checking data/model behavior; Accountability: assign responsibility

Abbreviations & Keywords

- PII: personally identifiable information
- Bias: systematic error/unfairness; Fairness: equitable outcomes/treatment
- Audit: checking data/model behavior; Accountability: assign responsibility
- Drift: data changes over time; Monitoring: ongoing checks after deployment

Abbreviations & Keywords

- PII: personally identifiable information
- Bias: systematic error/unfairness; Fairness: equitable outcomes/treatment
- Audit: checking data/model behavior; Accountability: assign responsibility
- Drift: data changes over time; Monitoring: ongoing checks after deployment
- Sustainability: energy/compute cost considerations

Why This Unit Matters

AI systems influence real decisions:

- admissions, hiring, loans

So we must evaluate not only accuracy, but also **fairness, safety, privacy, and accountability**.

Why This Unit Matters

AI systems influence real decisions:

- admissions, hiring, loans
- healthcare triage and diagnosis support

So we must evaluate not only accuracy, but also **fairness, safety, privacy, and accountability**.

Why This Unit Matters

AI systems influence real decisions:

- admissions, hiring, loans
- healthcare triage and diagnosis support
- policing and surveillance

So we must evaluate not only accuracy, but also **fairness, safety, privacy, and accountability**.

Bias: Where It Comes From

- **Sampling bias**: training data does not represent real population

Bias: Where It Comes From

- **Sampling bias**: training data does not represent real population
- **Measurement/label bias**: labels reflect human/systematic errors

Bias: Where It Comes From

- **Sampling bias**: training data does not represent real population
- **Measurement/label bias**: labels reflect human/systematic errors
- **Historical bias**: past decisions encode unfairness

Bias: Where It Comes From

- **Sampling bias**: training data does not represent real population
- **Measurement/label bias**: labels reflect human/systematic errors
- **Historical bias**: past decisions encode unfairness
- **Proxy features**: non-sensitive variables correlate with sensitive ones

Fairness (High-Level)

Fairness can mean different things depending on context:

- Similar individuals should be treated similarly (individual fairness).

There is no single universal metric; choose based on domain and risks.

Fairness (High-Level)

Fairness can mean different things depending on context:

- Similar individuals should be treated similarly (individual fairness).
- Error rates should be similar across groups (group fairness).

There is no single universal metric; choose based on domain and risks.

Fairness (High-Level)

Fairness can mean different things depending on context:

- Similar individuals should be treated similarly (individual fairness).
- Error rates should be similar across groups (group fairness).
- Outcomes should not systematically disadvantage protected groups.

There is no single universal metric; choose based on domain and risks.

Fairness Metrics (Examples, not exhaustive)

- **Demographic parity**: positive prediction rates similar across groups

Different metrics can conflict; choose based on domain harms and legal/ethical constraints.

Fairness Metrics (Examples, not exhaustive)

- **Demographic parity**: positive prediction rates similar across groups
- **Equal opportunity**: similar true-positive rates across groups

Different metrics can conflict; choose based on domain harms and legal/ethical constraints.

Fairness Metrics (Examples, not exhaustive)

- **Demographic parity**: positive prediction rates similar across groups
- **Equal opportunity**: similar true-positive rates across groups
- **Error-rate balance**: similar FPR/FNR across groups

Different metrics can conflict; choose based on domain harms and legal/ethical constraints.

Privacy Risks

- Training data may contain sensitive information.

Mitigations: data minimization, access control, anonymization (with caution), audits.

Privacy Risks

- Training data may contain sensitive information.
- Models can leak information (membership inference, memorization).

Mitigations: data minimization, access control, anonymization (with caution), audits.

Privacy Risks

- Training data may contain sensitive information.
- Models can leak information (membership inference, memorization).
- Sharing data across teams/vendors increases risk.

Mitigations: data minimization, access control, anonymization (with caution), audits.

Safety and Misuse

- Misclassification can cause harm (medical, finance).

Safety and Misuse

- Misclassification can cause harm (medical, finance).
- Models can be attacked (adversarial inputs) or misused.

Safety and Misuse

- Misclassification can cause harm (medical, finance).
- Models can be attacked (adversarial inputs) or misused.
- Monitoring and human oversight are often required.

Responsible AI Checklist (Practical)

Before deployment, ask:

- Who can be harmed by errors? (FP vs FN costs)

Responsible AI Checklist (Practical)

Before deployment, ask:

- Who can be harmed by errors? (FP vs FN costs)
- Are results consistent across groups/subpopulations?

Responsible AI Checklist (Practical)

Before deployment, ask:

- Who can be harmed by errors? (FP vs FN costs)
- Are results consistent across groups/subpopulations?
- What data/PII is used and who has access?

Responsible AI Checklist (Practical)

Before deployment, ask:

- Who can be harmed by errors? (FP vs FN costs)
- Are results consistent across groups/subpopulations?
- What data/PII is used and who has access?
- How will drift be detected and handled?

Responsible AI Checklist (Practical)

Before deployment, ask:

- Who can be harmed by errors? (FP vs FN costs)
- Are results consistent across groups/subpopulations?
- What data/PII is used and who has access?
- How will drift be detected and handled?
- Is there a human escalation/appeal path?

Environmental Considerations

- Training large models consumes energy and compute.

Environmental Considerations

- Training large models consumes energy and compute.
- Efficiency matters: smaller models, fewer features, fewer retrains.

Environmental Considerations

- Training large models consumes energy and compute.
- Efficiency matters: smaller models, fewer features, fewer retrains.
- Choose "good enough" accuracy when marginal gains cost huge resources.

Inclusive Design (Women & Society)

- Ensure datasets represent diverse users (avoid under-representation).

Inclusive Design (Women & Society)

- Ensure datasets represent diverse users (avoid under-representation).
- Evaluate outcomes across groups; investigate gaps.

Inclusive Design (Women & Society)

- Ensure datasets represent diverse users (avoid under-representation).
- Evaluate outcomes across groups; investigate gaps.
- Use participatory design: stakeholders help define success and risks.

Summary

- Responsible AI requires fairness, privacy, safety, and accountability checks.
- Bias can enter via data, labels, and historical decisions.
- Sustainability matters: compute/energy trade-offs should be considered.

Exit Questions

1. List three sources of bias in ML datasets.
2. Give one example where fairness concerns are critical.
3. What is one privacy risk of ML models (not just datasets)?
4. Name two ways to reduce environmental impact of ML systems.
